# Water Balance in Nontree Sub-district

## In rainy season

## Surface water balance

Rainfall = 101 Mm<sup>3</sup>/yr

SW storages = 10 Mm<sup>3</sup>/yr

Natural recharge = 21.5 Mm<sup>3</sup>/yr

Evaporation = 1.0 Mm<sup>3</sup>/yr

Evapotranspiration (rainy season) = 44.5 Mm<sup>3</sup>/yr

Flow out from the area = 23.5 Mm<sup>3</sup>/yr

## In dry season

The water needs of the crops

7.68 Mm<sup>3</sup>/yr

SW storages = 10 Mm<sup>3</sup>/yr

- Evaporation 2.5 Mm<sup>3</sup>/yr
- Ecosystem 3.5 Mm<sup>3</sup>/yr
- Remaining 4.0 Mm<sup>3</sup>/yr

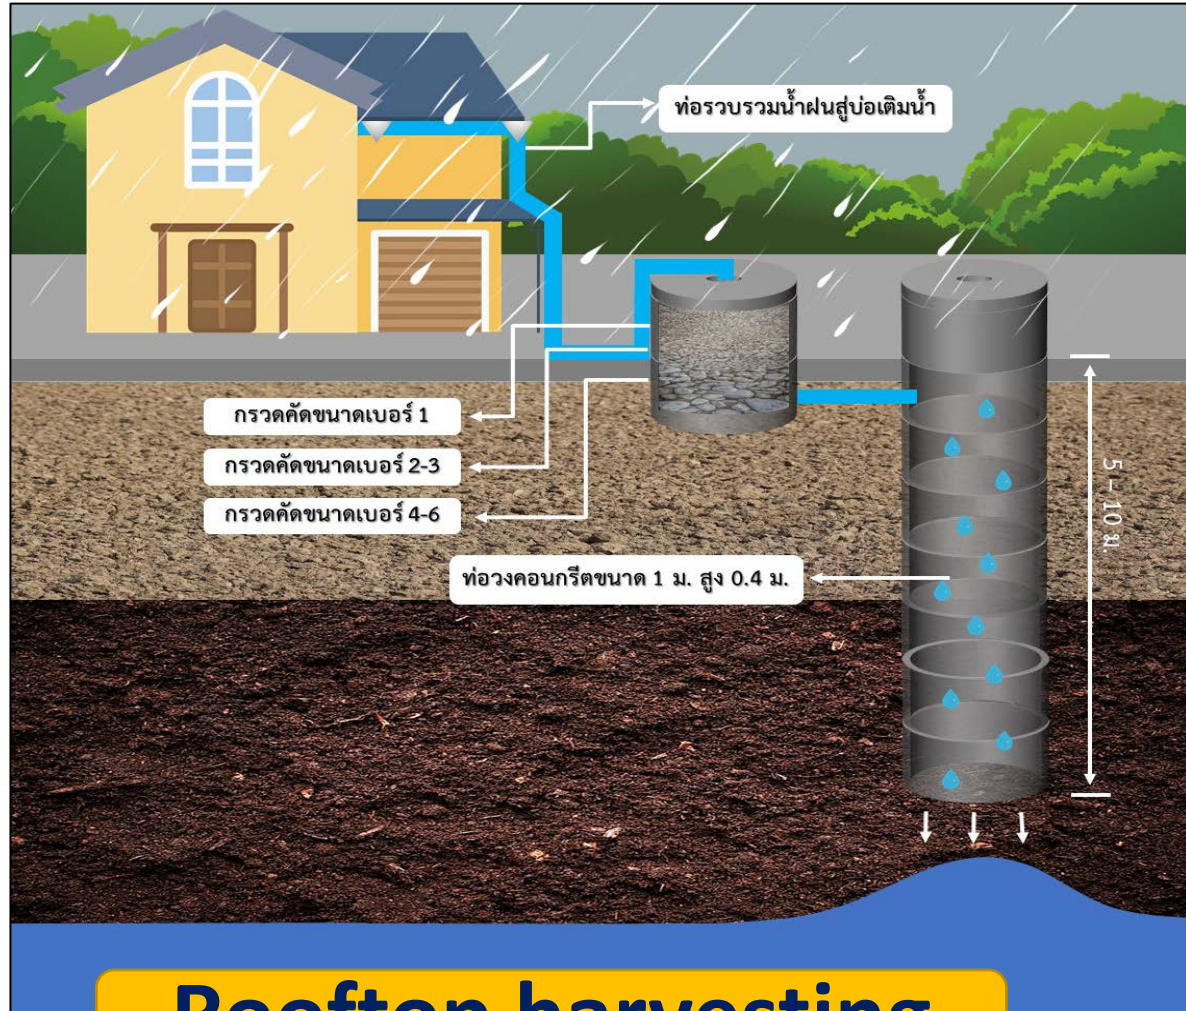

Water shortage 3.68 Mm<sup>3</sup>/yr

# Change in shallow groundwater level

# Conclusion and Recommendations

- 1. From 2019-2021, the total volume of recharged water to shallow aquifer is around 2.9 Mm<sup>3</sup> in Prachinburi Province and 2.5 Mm<sup>3</sup> in Nontree from 34 systems.**
- 2. The efficiency of MAR systems varies by 20% by the annual rainfall pattern.**
- 3. The shallow groundwater is gradually increased when compared at the same time of the year, especially in the dry season.**
- 4. The shallow groundwater level in this area was increased by around 1.7 m. and the spreading area of recharged water is about 4.5 km<sup>2</sup> in 2021.**

# Thank you
